

TECHNOLOGY DIGEST - CNC TURNING CENTRES AND CONVENTIONAL LA

Reference library item REF-01. Imported 02 Sep 2026 after review. Public literature summary.

1. PRODUCTIVITY

CNC turning centres typically cut cycle time by 50 to 65% on repeat batch work.
Scrap on turned parts typically falls below 2% with CNC and in-process gauging.

2. RETROFIT OR REPLACE

A CNC retrofit of a conventional lathe costs 35 to 50% of a new turning centre.
A retrofit does not correct bed wear above 0.10 mm; such machines should be replaced.

3. ENERGY AND PEOPLE

IE3 spindle motors use 8 to 12% less energy than IE1 motors at typical duty.
Conventional machinists typically need 3 to 4 weeks of training on a CNC turning centre.
